5. Challenges
allenges faced ouble click the cell to see full list
Continuous and Adequate Water Supply for all. High NRW and water losses due to kages. Quality of water Surface water and ground sources polluted. Efficient O & M. Ageing infrastructure, increasing urbanization, industrialization and population. Financial deterioration, frequent natural disasters: famine and floods.
Financial Deterioration e most of water utilities face to the problem of Financial Deterioration because of venue Reduction by Population declining and Decrease of Water Consumption per pita. In addition, Grants from Central Government are also decreasing. Aging Facilities & Aging Pipelines tio of aging facilities and aging pipelines are increasing because of the financial cerioration. Earthquake Resistance rge scale earthquakes occur frequently in Japan. However, ratio of the earthquake- sistant pipelines is only 39.3%. Decrease in Highly Skilled Workforce e most of water utilities face to the problem of transferring technique and owledge because of retirement of highly skilled workforce. In addition, the numbers staffs in each utility are decreasing because of financial deterioration of municipal vernment.
Vulnerability of Small Scale Water Utilities % of Japanese water utilities are small scale (Towns or villages). Such small scale lities are vulnerable to the financial base and the staff skills.
High Non Revenue Water at 36% national average is a concern and need more neerted effort to provide budget and technical solutions to address the problem ginning with meter changeout, pipe replacement and a dedecated NRW and akage control setup in each water perator to focus and follow up. Overall aging nfrastructure and system that needs urgent attention and proper set management using the advances of digital age Deteriorating water quality due to uncoordinated and ineffective water resources ntrol and planning and catchment protection / reserve etc.including pollution from npoint sources due to development upstream of intakes.
Turbid tap water (Local government) rbid tap water had supplied at some major cities because of outdated pipeline and stakes of engineers. Organization separation (KWWA) rtification department of KWWA will be separated to independent organization on s December.
Climate change phoon happen frequently and bring the heavy torrential rain. Aging facilities and aging pipeline cause the financial deterioration and the excavation control of the road authority Earthquake resistance cause aging facilities and aging pipeline the turbidity of raw water
MWA has a high level of water leakage caused by the aging pipeline networks. erefore, MWA has policy to reduce water loss to 19% by 2021. MWA use the conventional treatment system which is not suitable for the current ceriorated v water. Therefore, MWA has to adapt the new advanced technology in the atment process. MWA should provide the reserved system to ensure that MWA can serve the cable water when faced severe situation.
Convince Local Administrative who run their own waterworks system for the inicipal which account for 58% of water meter in the country. WA alwawys extends technical assistance to Local Authority to upgrade their water oply system. For the transferring of Local Atuhority water supply system to PWA, 'A will consider the possibility of investment cost. The transferred water supply stem of Local Authority must not be burden of PWA in term of financial aspect. Expand corporate member as this would also mean to get more involvement from vate sector as to date we have very few corporate member. t presetn there are 12 private sector participation projects (PPP) in the near future. water supply is urgently needed in some area and PWA could not serve it, PWA will y treated water from private sector for a short period to solve the problem. Recruting members from AEC- 10 countries member.
Renewal and Replacement of aging water and wastewater infrastructure. Financing for Capital improvements. Public understanding of the value of water systems and services.
Water supply has not kept pace with growing population in the last few decades. Many water utilities face financial difficulties because tariffs are too low to recover sts and systems are too small to work efficiently. Persistent problems include: institutional fragmentation, weak sector planning and monitoring due to lack of sector information, ) poor performance of many water utilities, )low private and public sector investment and limited access for service expansion, d inadequate support for poor urban communities and rural water supply. purce: ADB – Philippines Water Supply and Sanitation Sector Assessment, Strategy, d Road Map, January 2013)
